UPTOWN HOUSTON TRAFFIC ENGINEERING SERVICES

This project consisted of design and construction administration for the comprehensive mobility improvements in the Uptown Houston area. The project included traffic signals, lighting, utilities relocation, and pedestrian flow improvements, which transformed the urban landscape. Efforts included design documentation and permitting, value schedule and budget; and coordination among the many authorities, utilities, and private entities in the area.

Working with Uptown Houston was an ongoing commitment to assure that access to the area's businesses and stores was simple and rapid, and that traffic congestion during peak times was minimized.

In response to area businesses' design to improve the "sense of place" in Uptown, a comprehensive traffic management and signage improvement program was undertaken. Efforts included leading the project team that designed and oversaw construction of a system of new traffic signal standards, signage, street lighting, and decorative arches. The new look of Uptown's traffic system has created a memorable architectural landmark in Houston.
